# Consultants guide to SqlIDBM:

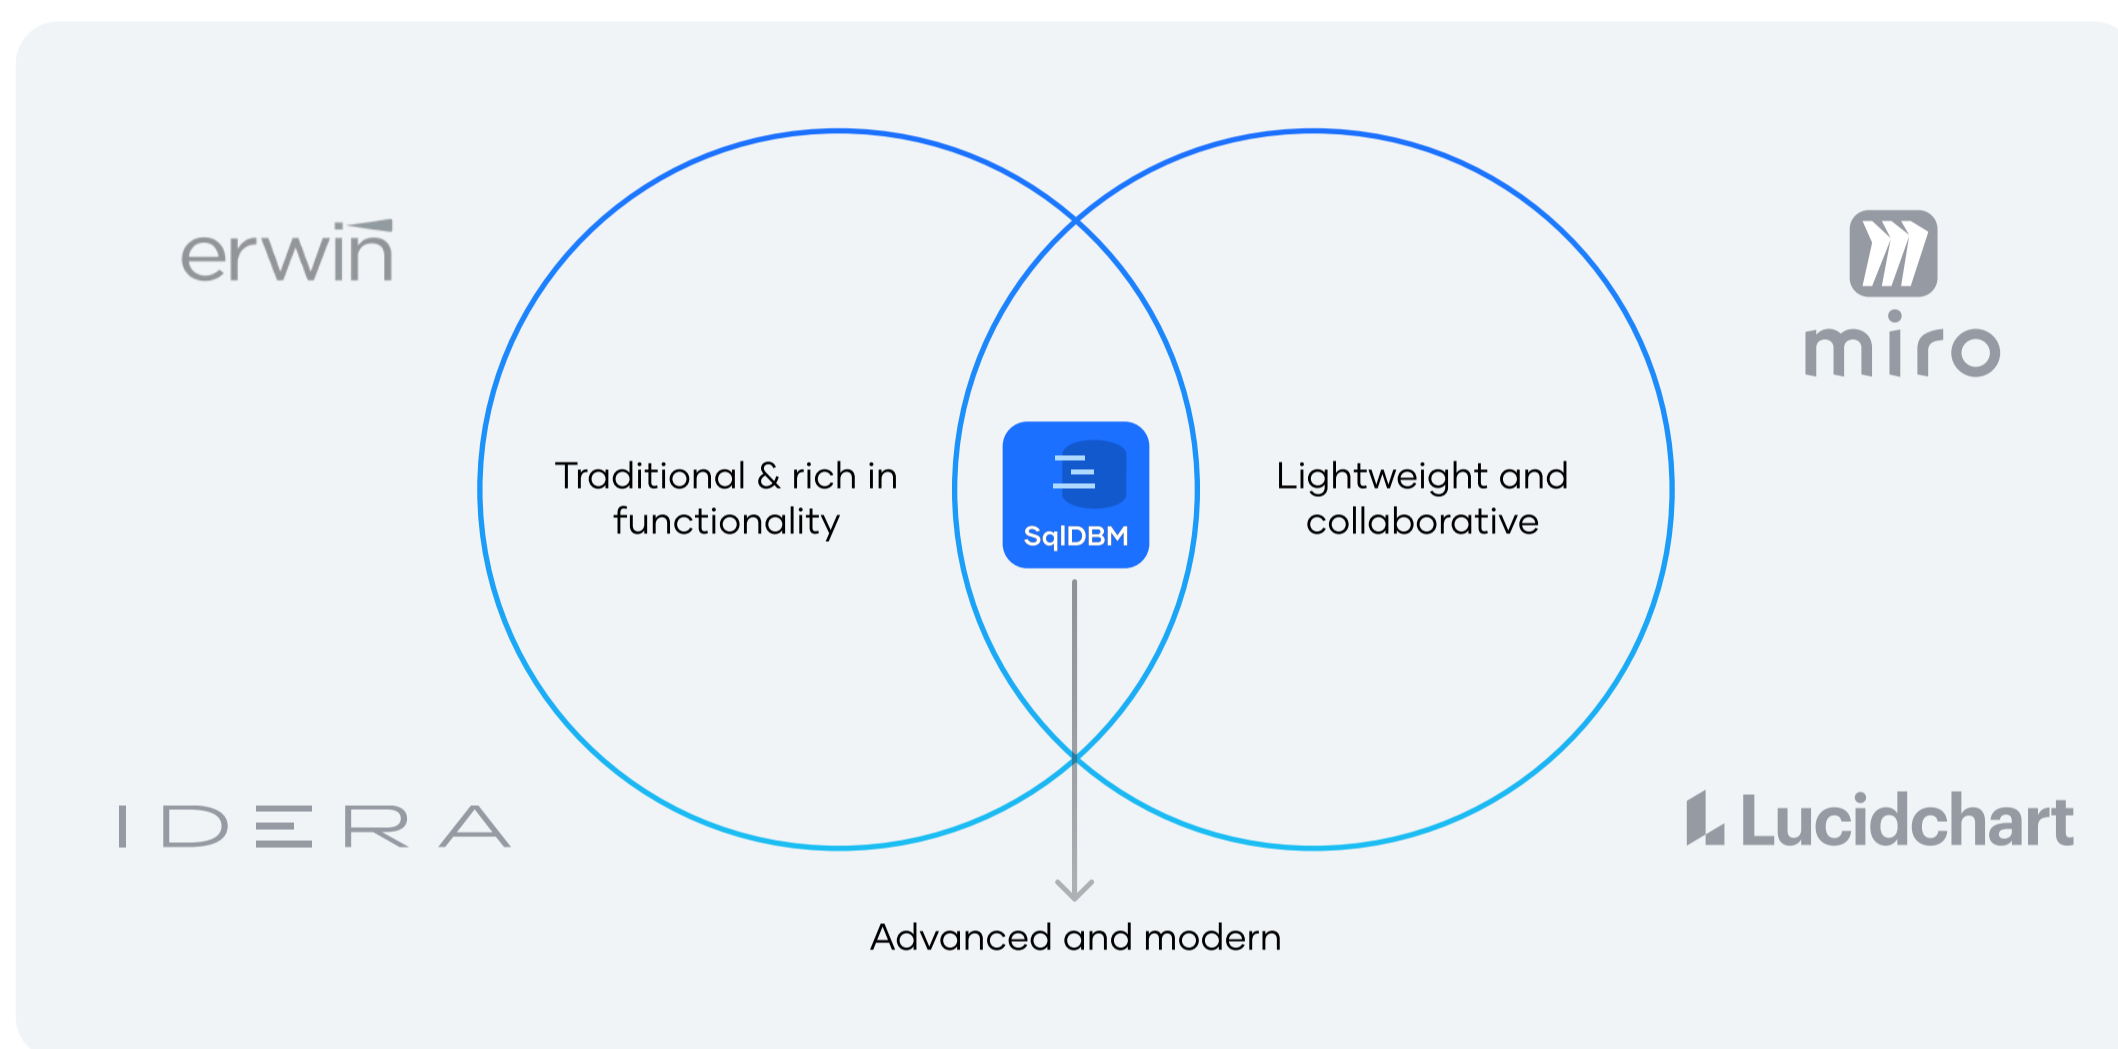

A high-level overview of  
our features and differentiators

# What is SqlDBM?

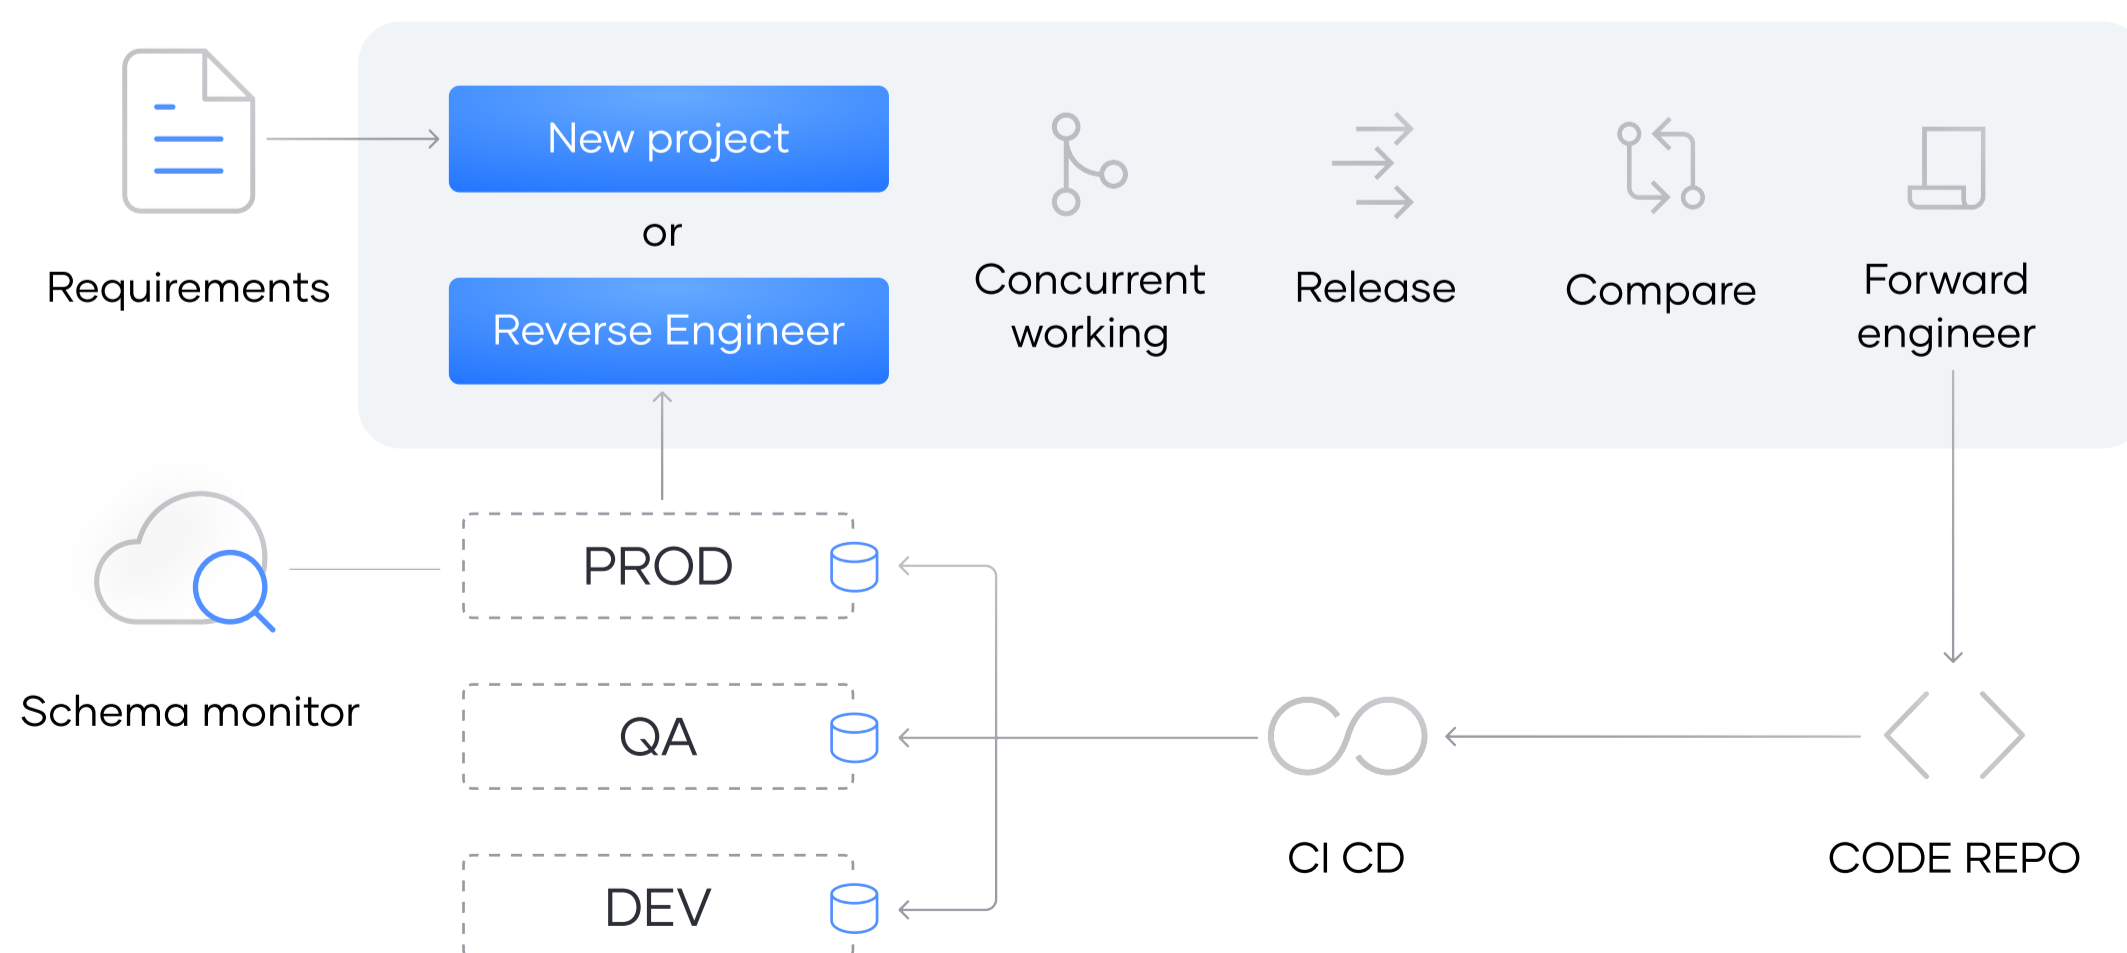

SqlDBM is a **cloud-native database modeling tool** that lets you create, share, document, and collaborate on your database models without the need to write code.

Empower **data architects** and **other data stakeholders** with visual data models.

# What does SqlDBM do?

# Modeling Life Cycle with SqlDBM

# Data modeling

## Standard modeling features

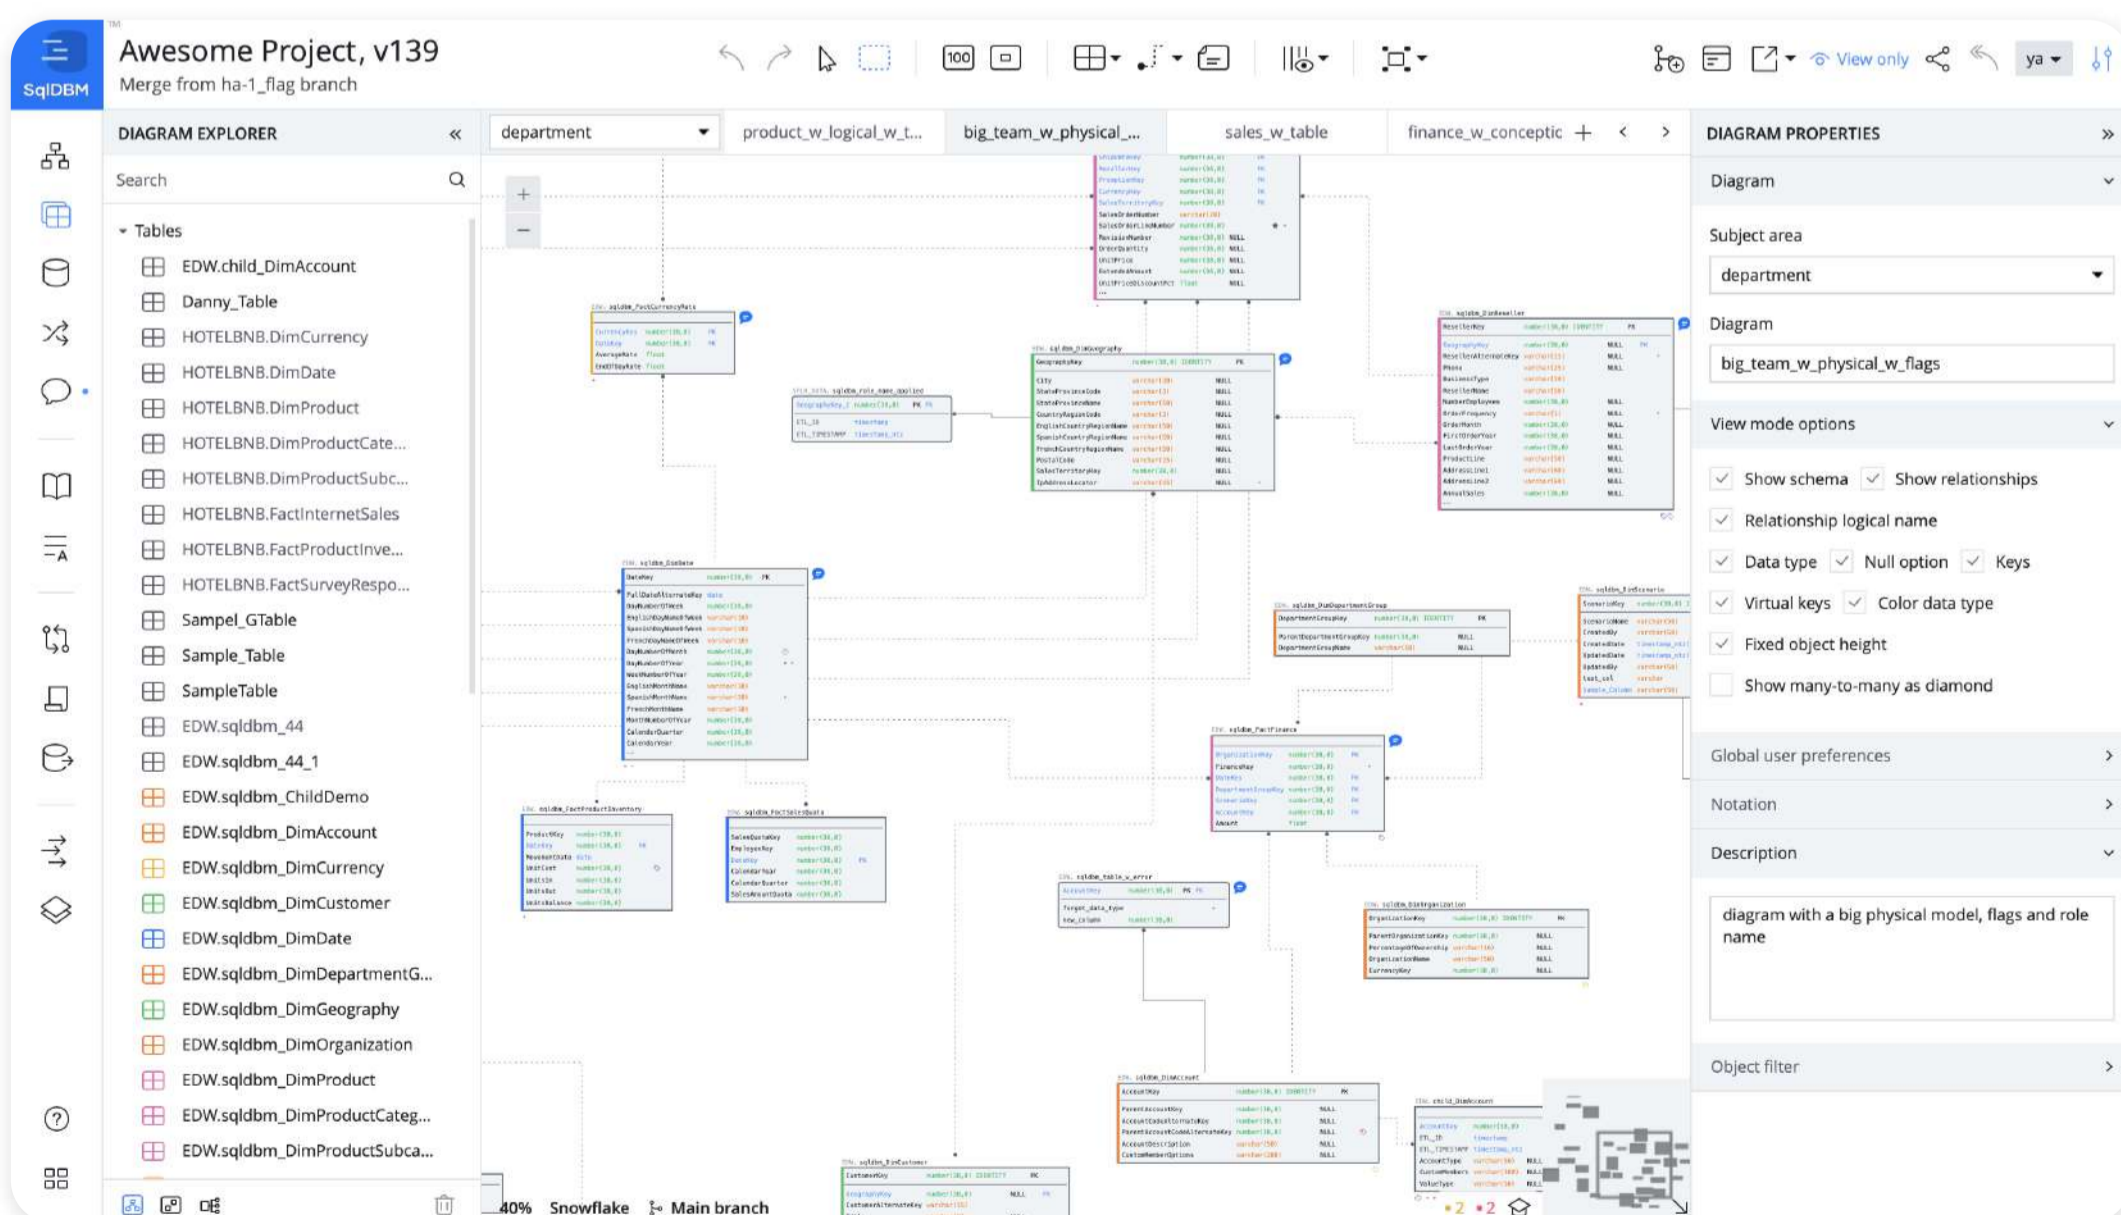

- ✓ RE/FE
- ✓ Diagram and subject area management
- ✓ Templates & naming conventions
- ✓ DB conversion
- ✓ Errors & warnings
- ✓ Extended object support
- ✓ Auto-suggested relationships
- ✓ Data dictionary

## Version Control & Compare

- ✓ Revision comparisons, connect to multiple environments, alter script generation

## Collaboration

- ✓ Read-only licenses, Team communication and concurrent modeling

# Observability

- ✓ Snowflake Schema Monitoring. Control your monitoring jobs from a single dashboard
- ✓ Visual Change log

The screenshot displays the 'DB Schema monitoring' dashboard. On the left is a sidebar with navigation options: Account Settings, Change password, Subscription Plan, Admin Console, User Projects, Integrations, App Tokens, and DB schema. The main content area shows a table of monitoring jobs with columns for Job name, Last run, DB name, Schema, and Notification. A 'Create monitoring job' modal is open in the foreground, containing fields for Name, Server, Username, Password, and Role, along with a 'Select schema' button.

Job name	Last run	DB name	Schema	Notification
Dev Snowflake	May 12, 2023 12:45 AM UTC	Dev DB	dbo and 2 more	5 users
Beta Snowflake	May 12, 2023 12:10 AM UTC	Dev DB	dbo and 2 more	12 users
Stage Snowflake	May 12, 2023 11:30 AM UTC	Dev DB	dbo and 2 more	No
Snowflake	May 12, 2023 09:08 AM UTC	Dev DB	dbo and 2 more	No

# Governance

- ✓ Extended metadata fields
- ✓ Pages
- ✓ Reports

The screenshot displays the SqDBM interface for 'Awesome Project, v139'. The main area shows a table of database objects with the following columns: Name, Flags, and Logical name. The objects are organized into schemas: SFLK\_DATA and EDW. The SFLK\_DATA schema contains several tables and views, including 'Table : SFLK\_DATA.sqldbm\_DimReseller\_child', 'ResellerKey', 'ResellerAlternateKey', 'BusinessType', 'ResellerName', 'NumberOfEmployees', 'ETL\_ID', 'ETL\_TIMESTAMP', and 'FK\_sqldbm\_DimReseller\_sqldbm\_DimReseller\_child'. The EDW schema contains 'Table : SFLK\_DATA.sqldbm\_role\_name\_applied', 'GeographyKey\_2', 'ETL\_ID', 'ETL\_TIMESTAMP', and 'FK\_sqldbm\_DimGeography\_sqldbm\_role\_name\_applied'. The 'Flags' column shows various tags such as 'PII', 'Finance', '1', and 'Fail'. The right-hand panel, 'DB DOCUMENTATION PROPERTIES', includes sections for 'Content options' (Name, Type, Options, Null option, Tags, Flags, Logical name, Description) and 'Data governance fields' (access, docs, external, freshness, identifier, latest\_version, loaded\_at\_field, model\_config, quote, quoting, source\_table\_config, tags, tests, versions).

# Our differentiators

## Ongoing value

Receive monthly feature releases without the need to upgrade versions.

## Anytime, anywhere

Access models from any location, and minimize downtime.

## Empowering teams

With our concurrent working decentralized teams can work collaboratively will focused on autonomous priorities. While following consistent standards and patterns.

## Accelerate design

Accelerate your time to market leveraging essential features such as naming standards, column templates and tale templates

# Easy Integrations

Confluence

GitLab

GitHub

Azure DevOps

BitBucket

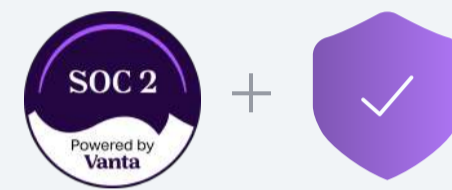

Jira

AWS  
CodeCommit

# Security

- ✓ SOC 2 Type II
- ✓ Customer-hosted storage
- ✓ Customer-managed keys
- ✓ Direct connect
- ✓ Audit logs monitoring
- ✓ IP access management
